

## AAA's High Performance Epoxy Process

### Cleaning

AAA uses the best cleaners available to remove oil, debris and dirt from your floor prior to mechanical surface preparation. Thorough cleaning removes contaminants which can decrease the coating's ability to adhere.

### Mechanical Surface Preparation

AAA uses high tech methods to mechanically prepare your cleaned floor to ensure the best possible adherence of the primers and finish coats. We use mechanical grinding and/or shot blasting methods, which are virtually dust-free and odorless.

### Priming

AAA uses high performance penetrating primers that will anchor your floor surface into the concrete to create a mechanical bond between the epoxy and substrate.

### Finish Coats

AAA uses only the finest 100% solids, polyurea, water-based and solvent-based systems available in the industry to create a surface that provides excellent acid, chemical and abrasion resistance, as well as sustained durability.

### Striping

AAA can install striping on your floor in a variety of colors to help you improve traffic flow and safety in your work areas.

### Clear Coat

AAA suggests a clear coat on your newly installed floor system to help increase the life of your floor as well as make it easier to clean and maintain.

**Committing to AAA's High Performance Epoxy Process earns you AAA's exclusive 3 year warranty.**
